Week #9

Manishah (19526)

① What is the difference between 6.2 & 6.3

→ For 6.2 → we can share data between multiple container using volums.

→ For 6.3 → we can share access data using hostpath volume. We can point to specific file or directory on the node's filesystem.

- Read the node's file
- use node's filesystem to access.

② What is the different between 6.3 & 6.4

→ For 6.3 → we can access data from node's filesystem.
→ volume content store specific node's filesystem when the database pods get rescheduled to another node.

For 6.4 → when application running in a pod needs to persist data to disk and have the same data available even when the pod is reschedule to another node.
